

# Treatment Of Pulmonary Hypertension: Current Cardiovascular Therapy

## What is pulmonary hypertension?

Pulmonary hypertension is a condition in which the blood pressure in the arteries that carry blood from the heart to the lungs is abnormally high. This can lead to a number of problems, including:

- \* Shortness of breath
- \* Fatigue
- \* Chest pain
- \* Lightheadedness
- \* Dizziness
- \* Fainting
- \* Swelling in the legs, ankles, and feet
- \* Bluish tint to the skin or lips

Pulmonary hypertension can be caused by a number of underlying conditions, including:

- \* Chronic obstructive pulmonary disease (COPD)
- \* Emphysema
- \* Asthma
- \* Pulmonary fibrosis
- \* Sarcoidosis
- \* Scleroderma
- \* HIV infection
- \* Congenital heart disease
- \* Pulmonary embolism
- \* Sleep apnea

### How is pulmonary hypertension diagnosed?

Pulmonary hypertension is diagnosed with a physical examination, a medical history, and a number of tests, including:

- \* Chest X-ray
- \* Echocardiogram
- \* Right heart catheterization

### How is pulmonary hypertension treated?

There is no cure for pulmonary hypertension, but there are treatments that can help to improve symptoms and quality of life. These treatments include:

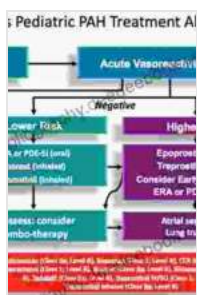

- \* Medications to lower blood pressure in the肺动脉
- \* Oxygen therapy
- \* Diuretics to reduce fluid retention
- \* Blood thinners to prevent blood clots

Surgery to repair or replace damaged heart valves or肺动脉

## What is the prognosis for pulmonary hypertension?

The prognosis for pulmonary hypertension depends on the underlying cause of the condition. With early diagnosis and treatment, many people with pulmonary hypertension can live full and active lives. However, the condition can be fatal if it is not treated promptly.

Pulmonary hypertension is a serious condition, but there are treatments that can help to improve symptoms and quality of life. If you have any of the symptoms of pulmonary hypertension, it is important to see your doctor right away.
